

MISSION EDGESIGHT

Any sensor. One mission picture.
Faster, better-informed decisions.

Turning fragmented edge sensor data into a shared mission picture, prioritized risk, and faster decisions from the forward edge to the commander even when communications are degraded.

Mission EdgeSight is a decision advantage layer for the tactical edge: it reduces cognitive burden, accelerates shared understanding, gives commanders force-wide visibility across distributed edge forces, and helps both forward operators and leaders focus attention where it can change outcomes.

OPERATIONAL NEED

Senior leaders do not need another data feed, they need confidence, speed, and clarity. Tactical edge units need the same thing when operating disconnected from higher headquarters.

Mission EdgeSight creates a practical path from distributed sensing to decision advantage by continuously turning edge observations into mission context, risk cues, and actionable understanding at both the tactical edge and command level.

EXECUTIVE VALUE

Mission EdgeSight helps leaders move from fragmented observations to operational confidence by connecting what sensors see with what the mission requires.

- **See faster:** Fuse many sensor types into one operational picture.
- **Understand sooner:** Correlate activity across time, location, and behavior.
- **Decide better:** Prioritize alerts by mission relevance, risk, and commander intent.
- **Operate through disruption:** Maintain local awareness when networks are degraded or denied.
- **Scale affordably:** Integrate new sensors and analytic services without redesigning the mission workflow.
- **Leader questions answered:** What is happening, why does it matter, what should I pay attention to, and how soon can I act?

WHAT MAKES IT DIFFERENT

Mission EdgeSight emphasizes commander utility over technical novelty: it uses a modular, open systems approach, is sensor-agnostic, mission-aware, edge-resilient, and designed to explain why something matters.

- **Modular, Open Systems Approach:** Built on a modular, open-standards architecture with a published API for rapid integration and component-level upgrades.
- **Sensor-agnostic:** Supports current and future sources without locking the mission to one device or vendor.
- **Mission-aware:** Filters activity through routes, objectives, areas of interest, red/blue fingerprints, and known threat zones.
- **Decision-focused:** Presents risk, confidence, and recommended attention areas in leader-ready language.

BUILT FOR DDIL OPERATIONS

Designed for contested environments. Even during communications loss, forward systems continue collecting, correlating, assessing, mapping, and preserving mission state locally. This ensures edge forces maintain situational awareness and decision support while disconnected. When connectivity is restored, the systems automatically synchronize.
